ANALOGS OF RECEPTOR TYROSINE ACTIVATION  
MOTIFS AND THERAPEUTIC USES THEREOF

5

1. INTRODUCTION

The present invention relates to peptides and analogs and derivatives thereof that are related to all or a portion of tyrosine activation motifs found in multichain immune recognition receptors.

10 Such peptides, analogs, and derivatives have utility in the treatment of diseases or disorders associated with undesirable or inappropriate immune activity or inflammation.

15

2. BACKGROUND OF THE INVENTION

2.1. IMMUNOGLOBINS AND THE IMMUNE RESPONSE

The immune system consists of lymphocytes, macrophages, and other specialized cells. An organism responds to antigen by virtue of having a large number of lymphocytes, each bearing receptors which recognize distinct antigens. B lymphocytes are precursors of antibody-secreting cells, and T lymphocytes are involved in regulatory and effector functions. In addition, natural killer cells mediate certain cytotoxic responses. (See generally, *Fundamental Immunology*, 1989, 2d Ed., Paul, W.E. (ed.), Raven Press Ltd., New York; Benacerraf & Unanue, 1979, *Textbook of Immunology*, Williams and Wilkins, Baltimore).

30

Cellular (or cell-mediated) immunity results from the activity of T lymphocytes that have been sensitized to an antigen by virtue of their recognition of the antigen via their T cell antigen receptor complex (see generally, Hedrick, 1989, in *Fundamental Immunology*, 2d Ed., ch. 11, Paul, W.E. (ed.), Raven Press Ltd., New York, pp. 291-313; Weiss,

35

1989, in *Fundamental Immunology*, 2d Ed., ch. 13, Paul, W.E. (ed.), Raven Press Ltd., New York, pp. 359-384).

Antibody or humoral immunity is mediated by  
5 molecules called antibodies that combine specifically  
with antigens; immunoglobulins are proteins with  
antibody activity. There are five classes of human  
immunoglobulins, differing in the structure of their  
respective heavy chains: IgG, IgA, IgM, IgD, and IgE.  
10 Immunoglobulins are synthesized by B lymphocytes, and  
by their progeny, the plasma cells. B cells interact  
with antigen via the antibody molecules in their  
plasma membranes. Plasma cells secrete antibodies.  
IgGs are the major component of serum immunoglobulin,  
15 and the predominant antibody involved in a secondary  
immune response. IgM is the predominant antibody  
involved in a primary immune response. IgD is a cell  
surface receptor present on mature B cells. IgA is  
found in bodily secretions. IgE is found in normal  
20 human serum at very low concentrations, and is  
involved in type I allergic reactions (atopy).

IgE appears to mediate local and systemic  
immediate hypersensitivity and anaphylactic reactions.  
Atopic individuals produce IgE in response to many  
25 environmental antigens. The event that initiates  
immediate hypersensitivity in such patients is the  
binding of antigen to IgE on the surface of mast  
cells. Binding of the Fc domain of the allergen-bound  
IgE to the extracellular domain of the FcεRI receptor  
30 complex on mast cells and basophils induces  
crosslinking of the receptor. Crosslinking of IgE  
receptors (FcεRI) causes mast cell activation and a  
cascade of intracellular signaling events which  
ultimately results in the release of lipid mediators  
35 of inflammation (leukotrienes, etc.), proinflammatory  
cytokines (interleukins, etc.) and of secretory

granules (containing histamine, 5-hydroxytryptamine, hexosaminidase, etc.). This release causes the appearance of many of the symptoms of acute allergic response.

## 2.2. MULTICHAIN IMMUNE RECOGNITION RECEPTORS

Cells respond to external stimuli through the binding of extracellular ligands to transmembrane receptor molecules. Binding of protein or peptide ligands to the extracellular domain of such a membrane-spanning receptor results in a conformational change or aggregation of the receptor, and a subsequent relay of the conformational signal induced by the external stimulus to the intracellular portion of the receptor. Intracellular signal transduction occurs via changes in the intermolecular associations of protein molecules arranged in a complex multi-step sequential pathway leading from the intracellular portion of the receptor to proteins involved directly in controlling gene expression, cytoskeletal architecture and cell division (Cantley et al., 1991, Cell 64:281-302). Recent research shows that signal transduction is accomplished at a molecular level via protein-protein complex formation, or, more specifically, by the creation of new protein-protein interaction sites, e.g., by enzymatic modification of tyrosine residues or by conformational changes induced by binding. Specific examples of intracellular signaling events modulated by protein-protein interactions are receptor-coupled G-protein activation, immunosuppression via immunophilin-immunosuppressive agent complexes and the release of the contents of secretory vesicles, e.g., histamine release in mast cell degranulation. Several protein-protein interaction sites involved in signaling have

been localized to short (less than 20 amino acid) contiguous sequences (see, e.g., Koch et al., 1991, Science 252:668-674).

5                   Multichain immune recognition receptors (MIRRs) (Keegan and Paul, 1992, Immunology Today 13:63-68) are found on T and B cells, mast cells, macrophages, natural killer cells and platelets. MIRRs constitute a family of immune cell receptors  
10 involved in the activation of cells involved in the immune system. MIRRs include the B cell antigen receptor complex (BCR); the T cell antigen receptor complex (TCR); Fc $\gamma$ RIII (Fc $\gamma$ RIIIA in humans), a  
15 receptor for the Fc region of IgG antibody molecules, found on mast cells, basophils, natural killer cells, macrophages, and neutrophils; and Fc $\epsilon$ RI, a receptor for the Fc region of IgE antibody molecules. These MIRRs consist of polypeptide chains that bind antigen  
20 or Fc, associated with chains whose intracellular domains contain a related short sequence of 18-27 amino acids termed the tyrosine activation motif ("TAM") (Samelson and Klausner, 1992, J. Biol. Chem. 267(35):24913-24916; Reth, 1989, Nature 338:383-384). The consensus sequence for the TAM is:  
25 (D/E)XXXXXXXX(D/E)XXYXXLXXXXXXXXYXX(L/I)X (SEQ ID NO:1), where X is any amino acid (Reth, 1989, Nature 338:383-384). Figure 1 schematically depicts these MIRRs.

30                   The TCR consists of the  $\alpha$  (alpha) and  $\beta$  (beta) T cell antigen receptor antigen-binding chains (which, in a minority of T cells, are replaced by the  $\gamma$  (gamma) and  $\delta$  (delta) heterodimer), the  $\gamma$ ,  $\delta$  and  $\epsilon$  (epsilon) chains of the CD3 complex, and a disulfide linked  $\zeta$  (zeta) dimer or heterodimer of  $\zeta$   
35 and  $\eta$  (eta) chains. The BCR consists of the heavy and light chains and at least one disulfide-linked

heterodimer consisting of Ig- $\alpha$  (MB-1 gene product) and Ig- $\beta$  (B29 gene product). The Fc $\epsilon$ RI receptor is a complex of three proteins, the  $\alpha$ ,  $\beta$ , and  $\gamma$  subunits.

5 The  $\alpha$  subunit of Fc $\epsilon$ RI binds IgE, the  $\beta$  subunit contains four transmembrane regions, and the  $\gamma$  subunit consists of a part of disulphide-linked chains (Fig. 2).

Most of the Fc $\epsilon$ RI- $\gamma$  subunit residues lie on the cytoplasmic side of the cell membrane. This  $\gamma$  subunit is shared by the Fc $\gamma$ RIII MIRR, and contains a TAM motif. Fc $\epsilon$ RI- $\beta$  also contains a TAM motif (but not Fc $\epsilon$ RI- $\alpha$ ), as do the CD3- $\gamma$ , CD3- $\delta$  and  $\zeta$  components of the TCR (but not the CD3- $\epsilon$  or TCR- $\alpha$  or TCR- $\beta$ ), MB-1 and B29 in the BCR, and the envelope protein (gp30) of bovine leukemia virus (Reth, 1989, Nature 338:383-384; see also Fig. 3 herein).

The function of the TAM motif in signal transduction has been investigated for the TCR. The consensus sequence shown above occurs in the  $\zeta$  chain of the TCR. Cell lines expressing a chimeric molecule in which the cytoplasmic tail of the  $\zeta$  chain was attached to the unrelated CD8 receptor respond to antibody crosslinking stimuli (Romeo et al., 1992, Cell 68:889-897).

Citation of a reference herein shall not be construed as an admission that such reference is prior art to the present invention.

### 30 3. SUMMARY OF THE INVENTION

The present invention is directed to peptides representing all or a portion of tyrosine activation motifs (TAMs), as well as analogs and derivatives thereof (collectively termed herein "TAM Mimics"). In particular, such analogs and derivatives include peptides and hybrid molecules with both

peptide and non-peptide portions. In a specific embodiment, a hybrid molecule is provided which contains an amino(N)- or carboxy(C)-terminal non-peptide helix inducer. In another specific embodiment, the hybrid molecule contains an internal non-peptide structure that maintains the helical character of the TAM mimic. TAM Mimics of the invention inhibit the activation of various cells with immune system function.

Therapeutic methods based on the immune function inhibitory activity of the TAM Mimics, as well as pharmaceutical compositions, are also provided. In a preferred embodiment of the invention, TAM Mimics are formulated for pulmonary administration; thus, for example, the invention provides inhalers containing compositions comprising a therapeutically or prophylactically effective amount of a TAM Mimic.

#### 4. DESCRIPTION OF THE FIGURES

Figure 1. Schematic diagram of four multichain immune recognition receptors (MIRRs): IgMR (the B cell antigen receptor complex), Fc $\gamma$ RIII, Ec $\epsilon$ RI, and TCR (the T cell antigen receptor complex). Two Fc $\epsilon$ RI receptors are depicted cross-linked by allergen binding. Two IgMRs are depicted cross-linked by antigen binding. TAM motifs are indicated by cross-hatching.

Figure 2. A schematic view of the MIRR for the Fc region of IgE, called the Fc $\epsilon$ RI receptor (after Keegan and Paul, 1992, Immunology Today 13(2):63-68).

Figure 3. TAM Motifs in the cytoplasmic tail sequences of various MIRRs. h, human; r, rat; m, mouse.

Figure 4. Exemplary TAM Mimic compounds of Formula (V).

Figure 5. Computer-generated drawings. The left side shows an idealized (computer-generated) drawing of an alpha-helical peptide. In the structure on the right, 7 amino acids (i.e., an 11 angstrom stretch) have been replaced by a "spacer molecule" like that present in a compound of formula (V).

Figure 6. Helix nucleating modules. N-terminal and C-terminal helix inducers are depicted. Compound I and Compound III were developed by Paul Bartlett (Bartlett et al., "Intuitive- and Computer-Assisted Approaches to the Design of Conformationally Restrained Peptides and Their Mimics," October 28-29, 1991, reprinted from Proceedings of The Robert A. Welch Foundation Conference on Chemical Research, XXXV Chemistry at the Frontiers of Medicine, Houston, Texas).

## 5. DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to peptides related to all or a portion of tyrosine activation motifs (TAMs), as well as analogs and derivatives thereof (collectively termed herein "TAM Mimics"). In particular, such analogs and derivatives include peptides and hybrid molecules with both peptide and non-peptide portions. In a specific embodiment, a hybrid molecule is provided which contains an amino(N)- or carboxy(C)-terminal non-peptide helix inducer. In another specific embodiment, the hybrid molecule contains an internal non-peptide structure that maintains the size and general shape of the TAM mimic. The TAM Mimics of the invention retain the conformational information of TAM motifs required for biological activity, however,

preferably incorporate sequence changes that provide the TAM Mimic with enhanced ability to cross lipid bilayers.

5           The TAM motif plays a critical role in the activation of the immune functions of T cells, B cells, mast cells, basophils, and natural killer (NK) cells. The TAM motif within receptor complexes appears to interact with target proteins that transmit the activation signal within the cytoplasm to bring about cellular immune responses. The TAM Mimics of the invention mimic the structure of these TAM motifs. While Applicants do not intend to be bound by any specific mechanism, Applicants believe that the TAM Mimics function by binding to the target protein, mimicking the interaction with the receptor-associated TAM motif, and thus preventing the natural activation of this target. Stimulation of mast cells, B lymphocytes, T lymphocytes, and macrophages is interfered with at the first stage in the stimulus-response coupling, thereby abrogating the responses of these cells.

10  
15  
20

The TAM Mimics of the invention thus act as inhibitors of the signal transduction events mediated by the various MIRRs containing TAM sequences, by competitively inhibiting the interaction of such molecules with an effector or regulatory molecule via their TAM motifs, and thus preventing the natural sequence of activation in MIRRs.

25

Therapeutic methods based on the immune function inhibitory activity of the TAM Mimics, as well as pharmaceutical compositions, are also provided. The TAM Mimics of the invention can also be used to study and elucidate the signal transduction mechanism in cells expressing the MIRRs.

30  
35

### 5.1. TAM MIMICS

The TAM Mimics of the invention include peptides and hybrid molecules, as detailed more fully in the subsections below.

#### 5.1.1. PEPTIDES

In a specific embodiment, the TAM Mimic is a peptide. Such a peptide can comprise all or a portion of a TAM motif actually present in a MIRR. For example, a TAM Mimic of the invention comprises or consists of all or a portion of the sequences shown in Figure 3 (SEQ ID NOS:2-12). In a preferred aspect, a TAM Mimic comprises or consists of the sequence (D/E)XXXXXXXX(D/E)XXYXXLXXXXXXXXYXX(L/I)X (SEQ ID NO:1). In another embodiment, a TAM mimic comprises or consists of the following sequences:

(D/E)XXYXXLXXXXXXXXYXX(L/I) (part of SEQ ID NO:1)  
DGGYMTLNPRAPTDDDKNTYLTLP (part of SEQ ID NO:2)  
DAVYTGLSTRNQETYETLK (part of SEQ ID NO:3)  
DRLYEELHVYSPIYSALE (part of SEQ ID NO:4)  
DQLYQPLKDREDDQYSHLQ (part of SEQ ID NO:5)  
DQVYQPLRDRDDAQYSHLG (part of SEQ ID NO:6)  
DGLYQGLSTATKDTDALH (part of SEQ ID NO:7, 8)  
ENLYEGLNLDDCSMYEDIS (part of SEQ ID NO:9, 10)  
DHTYEGLNIDQTATYEDIV (part of SEQ ID NO:11)  
EHTYEGLNIDQTATYEDIV (part of SEQ ID NO:12)

In yet another specific embodiment, a TAM Mimic peptide comprises or consists of the  $\beta$  or  $\gamma$  TAM motif, or a portion thereof, present in the human Fc $\epsilon$ RI complex, or one of the three TAM motifs, or a portion thereof, present in the human CD3 zeta chain; such TAM motifs are as follows:

#### Fc $\epsilon$ RI $\beta$ TAM motif:

EDRVYEELNILSATYSELEDPGEN  
(SEQ ID NO:26)

FcεRI γ TAM motif:

S D G V Y T G L S T R N Q E T Y E T L K H E K  
(SEQ ID NO:27)

5 CD3 ζ TAM motif #1:

Y Q Q G Q N Q L Y N E L N L G R R E E Y D V L D K R R  
G R D P E M G G K P (SEQ ID NO:28)

CD3 ζ TAM motif #2:

R R K N P Q E G L Y N E L Q K D K M A E A Y S E I G M  
K G E (SEQ ID NO:29)

10 CD3 ζ TAM motif #3:

R R R G K G H D G L Y Q G L S T A T K D T Y D A L H M  
Q A L P P R (SEQ ID NO:30)

The TAM motifs from different receptor  
15 subunits appear to specifically activate distinct  
biological responses in different cell types. For  
example, the TAM motif from the ζ subunit of the  
T cell receptor is not expected to be as active in  
activating mast cells as in activating T cells, the γ  
20 subunit TAM motif from the IgE mast cell receptor is  
not expected to be as active in activating T cells as  
in activating mast cells. The amino acid in  
SEQ ID NO:1 other than X are invariant residues that  
are shared by all members of the TAM family. These  
25 shared residues must be important for a common  
function of all of these domains, whereas the variant  
residues provide a structural scaffold or contribute  
specificity to this domain (i.e., recognition of  
different target proteins). Thus, TAM Mimics are also  
30 provided which specifically interfere with activation  
or immune responses in specific immune cells, by  
virtue of containing sequences of variant residues  
(e.g., residue numbers 2-8, 10-11, 13-14, 16-22,  
and/or 24-25 in SEQ ID NO:1) which are identical or  
35 substantially the same as those sequences present in  
MIRRs (see Fig. 3).

In a preferred aspect, immune activation of mast cells and basophils via the allergen-IgE receptor complex is interfered with by use of TAM Mimics which mimic FcεRI γ or β TAM motifs. In a preferred aspect,  
 5 a TAM mimic comprises one of the following sequences, related to the FcεRI γ TAM motifs:

D G V Y T G L S T R N Q E T Y E T L K (SEQ ID NO:19)  
   └───┘          └───┘  
 Q K V Y D K L L K R N Q E T Y E T L K (SEQ ID NO:14)  
           └───┘                          └───┘          └───┘  
 10 Q K V Y D K L L K R N Q E L Y E T L K (SEQ ID NO:15)  
                   └───┘          └───┘          └───┘  
 Q K V Y C K L L C R N Q E L Y E T L K (SEQ ID NO:16)  
                   └───┘          └───┘          └───┘  
 D G V Y T G L S T R N Q K T Y K T L K (SEQ ID NO:17)  
 N G V Y T G L S T R N Q K T Y K T L K (SEQ ID NO:18)  
 15

In the above-presented sequences, dashed lines represent potential salt bridges between the indicated residues; solid lines represent cyclization (covalent linkage) of the indicated residues.  
 20 Cyclization in SEQ ID NO:15 is via an amide linkage between the indicated residues. Cyclization in SEQ ID NO:16 is via disulfide bond formation. The envisioned salt bridges and the cyclizations are preferably present in the indicated sequences because  
 25 they are expected to increase the conformational stability of the peptide.

In a preferred aspect, the TAM Mimics consist of the following 19-mer peptides (Ac = acetyl; solid lines between residues indicates cyclization):  
 30 Ac-D G V Y T G L S T R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:19);  
 Ac-Q K V Y D K L L K R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:20);  
 Ac-Q K V Y D K L L K R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID  
 35 NO:21);

Ac-Q K V Y C K L L C R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID  
 NO:22);

5 Ac-D G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID  
 NO:23); and

Ac-N G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID  
 NO:24).

10 SEQ ID NO:13 is the actual sequence contained in the  
 C-terminal region of human FcεRI-γ.

In another embodiment, a TAM Mimic comprises  
 or consists of the sequence:

15 D X V Y X X L X X R N Q E X Y E T L K (SEQ ID NO:25)

TAM Mimics of the invention which have a  
 sequence more homologous to a TAM motif found in an  
 FcεRI γ or β chain than to other TAM motifs are  
 preferred for inhibition of mast cell (or basophil  
 20 cell) activation. TAM Mimics which have a sequence  
 more homologous to a TAM motif found in FcγRIII (or  
 FcγRIIIA) γ or δ chain are preferred for inhibition of  
 macrophage or natural killer cell activation. TAM  
 Mimics which have a sequence more homologous to a TAM  
 motif found in the B cell antigen receptor complex  
 25 (MB-1 or B29) are preferred for inhibition of B cell  
 activation. TAM Mimics which have a sequence more  
 homologous to a TAM motif found in the CD3-γ, CD3-δ,  
 or δ chain of the T cell antigen receptor complex are  
 preferred for inhibition of T cell activation.

30 The TAM Mimics of the invention can be  
 derived from TAM motifs of proteins of human or other  
 animal origin, including but not limited to mammals  
 such as cows, horses, pigs, sheep, goats, rats, mice,  
 dogs, chickens, rabbits, etc.

35 The peptide TAM Mimics of the invention have  
 a sequence in the range of 15-39 amino acids. In a

specific aspect, the peptides have a sequence in the range of 17-25 amino acids. In a preferred aspect, the peptides contain 19 amino acids.

5 The TAM mimic peptides of the invention preferably contain naturally-occurring amino acids. The most common naturally-occurring amino acids are shown in Table I:

10 TABLE I.  
NATURAL AMINO ACIDS AND THEIR ABBREVIATIONS

	<u>Name</u>	<u>3-Letter Abbreviation</u>	<u>1-Letter Abbreviation</u>
15	(+)-Alanine	Ala	A
	(+)-Arginine	Arg	R
	(-)-Asparagine	Asn	N
	(+)-Aspartic acid	Asp	D
	(-)-Cysteine	Cys	C
20	(+)-Glutamic acid	Glu	E
	(+)-Glutamine	Gln	Q
	Glycine	Gly	G
	(-)-Histidine	His	H
25	(+)-Isoleucine	Ile	T
	(-)-Leucine	Leu	L
	(+)-Lysine	Lys	K
	(-)-Methionine	Met	M
	(-)-Phenylalanine	Phe	F
30	(-)-Proline	Pro	P
	(-)-Serine	Ser	S
	(-)-Threonine	Thr	T
	(-)-Tryptophan	Trp	W
35	(-)-Tyrosine	Tyr	Y
	(-)-Valine	Val	V

However, the peptides of the invention are not limited to containing the 20 natural amino acids. In other embodiments, TAM mimic peptides can contain non-natural amino acids or cyclic peptides. Non-classical amino acids include but are not limited to the D-isomers of the common amino acids,  $\alpha$ -amino isobutyric acid, 4-aminobutyric acid, hydroxyproline, sarcosine, citrulline, cysteic acid, t-butylglycine, t-butylalanine, phenylglycine, cyclohexylalanine,  $\beta$ -alanine, designer amino acids such as  $\beta$ -methyl amino acids, C $\alpha$ -methyl amino acids, N $\alpha$ -methyl amino acids, and amino acid analogs in general. Furthermore, the amino acid can be the D (dextrorotary) or L (levorotary) amino acid.

The peptide may be prepared by methods that are known in the art. For example, in brief, solid phase peptide synthesis consists of coupling the carboxyl group of the C-terminal amino acid to a resin and successively adding N-alpha protected amino acids. The protecting groups may be any known in the art. Before each new amino acid is added to the growing chain, the protecting group of the previous amino acid added to the chain is removed. The coupling of amino acids to appropriate resins is described by Rivier et al., U.S. Patent No. 4,244,946. Such solid phase syntheses have been described, for example, by Merrifield, 1964, J. Am. Chem. Soc. 85:2149; Vale et al., 1981, Science 213:1394-1397; Marki et al., 1981, J. Am. Chem. Soc. 103:3178 and in U.S. Patent Nos. 4,305,872 and 4,316,891. In a preferred aspect, an automated peptide synthesizer is employed.

Purification of the synthesized peptides can be carried out by standard methods including chromatography (e.g., ion exchange, affinity, and sizing column chromatography), centrifugation,

differential solubility, or by any other standard technique for the purification of proteins. In a preferred embodiment, reverse phase HPLC (high performance liquid chromatography) is employed.

## 5.2. HYBRID MOLECULES WITH AMINO- OR CARBOXY-TERMINAL HELIX INDUCERS

TAM Mimics of the invention also include hybrid molecules that comprise peptides bound to amino- or carboxy-terminal helix inducers. In particular, such hybrid molecules are TAM Mimic peptides, in which two amino acid residues at the N-terminus and/or C-terminus of the peptide are replaced respectively by an N-terminal or C-terminal helix inducer, or a helix inducer of 0-3 residues can be added. Such helix inducers are nonpeptide organic structures that function as helix nucleating modules. Examples of N-terminal and C-terminal helix inducers, respectively in C-terminal or N-terminal linkage to a peptide amino or carboxyl group respectively, are shown in Figure 6.

In a specific embodiment, the invention thus provides a compound of formula (IIc), wherein X is OH or an amino-terminally linked peptide having a sequence in the range of 17-39 amino acids and comprising the sequence V Y T G L S T R N Q E T Y E T L K (part of SEQ ID NO:13).

(IIc)

In another specific embodiment, the invention provides a compound of formula (IVa), wherein X is a hydrogen atom or a carboxy-terminally linked peptide having a sequence in the range of 17-39 amino acids and comprising the sequence V Y T G L S T R N Q E T Y E T L K (part of SEQ ID NO:13).

10

(IVa)

15

In a preferred aspect of the invention, hybrid peptide (Ia) is produced, containing helix inducer (Ib) replacing the N-terminal DG in the sequence of the TAM Mimic Peptide TAM-1 (see Section 6) having the sequence:

20

D G V Y T G L S T R N Q E T Y E T L K (SEQ ID NO:13)

25

(Ia)

30

(Ib)

In specific embodiments, the C-terminus of compound (Ia) is the free acid, an ester (OR, where R is preferably an alkyl of 1-4 carbon atoms), or an amide.

35

By way of example, hybrid peptide (Ia) may be prepared according to Scheme I.

- 3,5-Dimethoxybenzoic acid is converted to its acid chloride by treatment with oxalyl chloride in dichloromethane at 0°C to room temperature (r.t.) for 5 h. The acid chloride is esterified using potassium tert-butoxide in tert-butanol at 30-40°C for 22 h yielding the tert-butyl ester (1). Birch reductive alkylation of (1) with potassium in a mixture of tert-butanol and ammonia with iodomethane as the alkylating reagent at 78°C for 2 h followed by treatment with mercurous nitrate at reflux in aqueous acetonitrile for 14 h affords the di-keto ester (2). Treatment of (2) with nitro ester (4) and triethylamine in methanol at 0°C to r.t. for 2 d gives the hydroxy di-ester (5). Olefin (4) is synthesized from methyl acrylate by reaction with iodine and nitrogen dioxide at 0°C for 1 h and then at r.t. for 4 h yielding (3) followed by elimination of hydrogen iodide with sodium acetate in ether at reflux for 3 h to give (4). Reduction of the nitro group of (5) with hydrogen at 50 psi using Raney nickel in MeOH/EtOH affords the diester (6) via concomitant ring closure of the amine produced by the reduction of the nitro group. Deprotonation of the amine (6) with potassium hydride followed by protection with 2-tert-Butoxycarbonyl)-2-tert-butyl-3-methyl-4-imidazolidinone yields the protected amine (7). Treatment of (7) with lithium hexamethyldisilazane and hexamethylphosphoramide in tetrahydrofuran at -78°C leads to the formation of the methyl ester enolate which is subsequently alkylated with iodomethane to yield a mixture of cis/trans (8). Selective hydrolysis of the methyl ester of (8) using lithium hydroxide followed by silica gel chromatography separation gives the desired cis-

diastereomer (9). The cis-acid (9) is coupled to  
L-valine benzyl ester using bromo-tris-pyrrolidino-  
phosphonium hexafluorophosphate and diisopropyl  
5 ethylamine in dichloromethane at 0°C to r.t. for 16 h  
to give a 1:1 mixture of diastereomers 10L and 10D.  
Hydrogenolysis of the mixture using hydrogen and a  
catalytic amount Pd/C followed by HPLC on a reverse  
phase column provides the desired diastereomer 11L  
10 along with diastereomer 11D. Coupling of 11L to TAM  
peptide 16-mer followed by removal of side chain  
protecting groups gives the desired hybrid peptide  
(Ia). The above-described synthetic scheme has been  
carried out as described to yield the hybrid peptide  
15 (Ia).

20

25

30

35

Scheme 1

In another aspect of the invention, hybrid peptide (IIa) is produced, containing helix inducer (IIb) replacing the N-terminal DG in the sequence of the TAM Mimic peptide TAM-1 (see Section 6.2).

By way of example, the N-terminal helix inducer IIb can be synthesized from L-aspartic acid and L-pyroglutamic acid, according to Scheme II.

Thus, L-pyroglutamic acid was first protected as its methyl ester by treatment with thionyl chloride in methanol at 0°C to room temperature (r.t.) for 20 h and then treated with triethyloxonium tetrafluoroborate in dichloromethane at r.t. for 2 d to give the imino ether (12). Reaction of the imino ether (12) with a 4-substituted-2-azetidinone (13) at 135°C neat for 4 h provided the desired hexahydro-pyrrolopyrimidine cis-dicarboxylic acid ester (14).

The azetidinone (14) was formed from treatment of L-aspartic acid dibenzyl ester with trimethylsilyl chloride and triethylamine at 0°C for 1 h followed by tert-butyl magnesium chloride treatment for 20 h. Deprotection of the methyl ester of (14) by treatment with 10% aqueous HCl at 50°C is expected to give the free acid (15), which is coupled to TAM peptide 17-mer followed by removal of side chain protecting groups to provide the desired hybrid peptide mimic (IIa).

Scheme II

### 5.3. HYBRID MOLECULES WITH INTERNAL HELIX REPLACEMENTS

TAM Mimics of the invention also include hybrid molecules with helix replacements to achieve gradual reduction of the peptide character of the molecules. In a preferred aspect, peptide hybrids of the invention are TAM Mimic peptides in which the peptide sequence corresponding to amino acid numbers 16-22 in the consensus sequence (SEQ ID NO:1) (see e.g. Fig. 3) are replaced by a phenothiazine ring structure.

Compounds of the invention thus include peptide-like hybrid molecules of the formula (V) where  $R^1$  is a sequence of at least 4, and is preferably 7, amino acids, wherein  $R^1$  comprises a C-terminal leucine, and a tyrosine in the fourth position counting from a C to N-terminal direction. Thus  $R^1$  corresponds to a portion of SEQ ID NO:1, amino-terminal to SEQ ID NO:1 residue number 16, except that the amino acid corresponding to residue number 9 of SEQ ID NO:1 can be any amino acid. In a specific but non-limiting aspect,  $R^1$  has a sequence in the range of 4-25 amino acids.  $R^2$  is a sequence of at least 4 amino acids, and is most preferably 5 amino acids, comprising an amino-terminal Tyr, and Leu or Ile in the fourth position counting in the N- to C-terminal direction. In a specific but non-limiting aspect,  $R^2$  has a sequence in the range of 4-25 amino acids, and preferably 4-6 amino acids.  $R^3$  is Hydrogen or  $C_1$ - $C_6$  alkyl. Z is S, SO, or  $SO_2$ .

(V)

A computer-generated drawing of a compound of formula (V) is shown in Figure 5.

A specific example of compound (V) is  
 5 compound (Va):

In specific embodiments, TAM Mimics of the invention which are peptide hybrids and which mimic  
 20 the FcεRI γ TAM, are of structure (V) in which R<sup>3</sup> is H; Z is S; R<sup>2</sup> is YETLK-NH<sub>2</sub> (part of SEQ ID NO:17); and R<sup>1</sup> is DGVYTGL (part of SEQ ID NO:17), QKVYDKL (part of SEQ ID NO:19), or QKVYCKL (part of SEQ ID NO:20).

Exemplary compounds of Formula (V) which may  
 25 be synthesized by the methods described herein are shown in Figure 4.

Compounds of Formula (V) wherein R<sup>3</sup> is hydrogen; Z is S, SO, or SO<sub>2</sub>; and disubstitution occurs at the 3 and 7 positions of the phenothiazine ring may  
 30 be prepared according to Scheme III. Condensation of 4-methyl aniline (16) (1 equiv.) (R. Adams, 1957, Org. Reactions, 3:240D) with ammonium thiocyanate under standard conditions [NH<sub>4</sub>SCN (2 equiv.) in HOAc, Br<sub>2</sub> in HOAc (1 equiv., 8-10°C, 1 h) yields the corresponding  
 35 5-methyl-2-amino benzothiazole (17). Hydrolysis of (17) using 50% aqueous potassium hydroxide affords the

potassium salt of 2-amino-4-methyl thiophenol (18). Protonation of (18) with five normal acetic acid affords the thiol (19) which when condensed with meta-  
5 nitrobromobenzene in ethanol yields the sulfide (20) (Mital, 1969, J. Chem. Soc. (C), 2148). Formylation of the amino function with formic acid or acetylation of the amine with acetic anhydride yields the  
10 formamide or acetamide derivative (21), respectively (Jain et al., 1991, Indian J. Chem. 9:1236). Smiles rearrangement (Jain et al., 1991, Indian J. Chem. 9:1236) of (21) leads to 3-bromo-7-methyl  
15 phenothiazine (22). Transmetallation of (22) with 2 equivalents of n-Butyllithium at -78°C in tetrahydrofuran followed by quenching with carbon  
dioxide yields the carboxylic acid (23). Carboxylic acid (23) is converted to its tert-butyl ester (24) via standard conditions (Armstrong et al., 1988, Tet.  
20 Lett. 29(20):2483). Benzylic bromination of the methyl group of (24) with N-bromosuccinimide at reflux in carbon tetrachloride affords the benzyl bromide  
which is treated with sodium azide to give the corresponding azido derivative. Reduction of the  
25 azide under standard conditions yields the amino ester (25). Peptide coupling with the amino end of (25) followed by conversion of the tert-butyl ester to a  
carboxylic acid followed by a second peptide coupling with the carboxyl end of (25) yields the desired  
peptide-like hybrid molecules.

30

35

## Scheme III

Compounds wherein R<sup>3</sup> is alkyl; Z is S, SO, or SO<sub>2</sub>; and disubstitution occurs at the 3 and 7 positions of the phenothiazine ring may be prepared according to Scheme IV. Treatment of phenothiazine with iodomethane in dimethylsulfoxide yields the N-methylated derivative (26). Reaction of (26) with pyridinium bromide perbromide yields the 3-bromo derivative (27) (L. R. Biehl et al., 1974, J. Heterocyclic Chem. 11:247) which is subsequently formylated with dimethylformamide and phosphorus oxychloride yielding the aldehyde (28). Reduction of the aldehyde with sodium borohydride in methanol affords the corresponding benzyl alcohol. The benzyl alcohol is converted to the phthalimido derivative (29) (Bose et al., 1973, Tet. Lett. 1619) to afford the protected benzyl amine (29) (Bose et al., 1973, Tet. Lett. 1619). The phthalimide group is removed with hydrazine producing the free benzyl amine which is subsequently protected as its BOC (tert-butoxycarbonyl) derivative (30) by reaction with 2-(tert-butoxycarbonyloxyamino)-2-phenylacetonitrile. Metallation of (30) with n-butyllithium at -78°C followed by quenching with carbon dioxide produces the carboxylic acid (31). Peptide coupling with the carboxyl end of (31) followed by deprotection of the amine followed by a second peptide coupling with the amino end of (31) yields the desired peptide-like hybrid molecules.

30

35

## Scheme IV

Compounds where R<sup>3</sup> is alkyl; Z is S, SO, or SO<sub>2</sub>; and disubstitution occurs at the 2 and 8 positions of the phenothiazine ring may be prepared according to Scheme V. 2-Chloro-phenothiazine (32) (available from Aldrich Chemical Co.) is acylated with acetic anhydride and pyridine to give (33). Freidel-Crafts acylation of ester (33) with aluminum chloride and acetyl chloride in carbon disulfide at reflux affords the N-acetyl-2-carbmethoxy-8-acetyl phenothiazine (34). The acetyl moiety of compound (34) is selectively converted to a carboxylate with sodium hypochlorite in dioxane with concomitant removal of the N-acetyl group (Baltzy et al., 1946, J. Amer. Chem. Soc. 68:2673) to yield the 2-carbmethoxy-8-carboxy-phenothiazine (35). Esterification of the carboxyl moiety of (35) with tert-butyl 2,2,2-trichloroacetimidate and boron trifluoride etherate produces the diester (36). N-methylation of (36) with iodomethane in dimethylsulfoxide yields the N-methyl phenothiazine (37). (37) is treated with n-butyl lithium at -78°C in tetrahydrofuran to produce a metallated intermediate which is quenched with α-bromo-α'-phthalimido methane to give (38). Hydrazinolysis of (38) yields the desired amino ester (39). Peptide coupling with the amino end of (39) followed by conversion of the tert-butyl ester to a carboxylic acid followed by a second peptide coupling with the carboxyl end of (39) yields the desired peptide-like hybrid molecules.

Scheme V

Schemes III, IV, and V, described *supra*, have been carried out as described. Particular compounds found in Schemes III, IV, and V have been synthesized according to the following protocols, presented by way of example:

#### Preparation of Compound 23

To a well stirred solution of 3-bromo-7methyl phenothiazine (1 equiv.) in 10-20 ml THF at  $-78^{\circ}\text{C}$ , add  $\eta\text{-BuLi}$  (2.5 M solution; 2 equiv.) slowly. After 30 min at  $-78^{\circ}\text{C}$ , pass dry  $\text{CO}_2$  gas through the reaction mixture for 15-20 min. Allow the reaction to come to r.t., quench it with water. Remove excess THF in vacuo. To the residue add a solution of sodium bicarbonate (1-2 equiv.). Wash the aqueous layer with ether (2 x 10 ml). After cooling the aqueous layer in ice, acidify with 5 N HCl to pH 2. Collect the crystals by filtration. Wash the crystals with water (10 ml). Dry in air. Recrystallize the acid from hot alcohol.

#### Preparation of Compound 28

This compound was prepared following the procedure for the preparation of indole 3-aldehyde from Indole Org. Synthesis Coll. Vol. 4, 539 (1972).

To dimethylformamide (DMF) (7.5 ml) cooled in ice was added freshly distilled  $\text{POCl}_3$  (3.22 g, 21 mmol) and this Vilsmeier complex was stirred at  $0^{\circ}\text{C}$  in an atmosphere of  $\text{N}_2$  for another 30 minutes. Then the 2-bromo-10-methyl phenothiazine (3.055 g, 10.55 mmol) was added in one lot followed by 2.5 ml DMF to rinse the side of the flask. After stirring at r.t. for 1 h (by which time the solid gets wetted by DMF and assumes a purple color), the flask was filled with a reflux condenser and heated on an oil bath at  $90^{\circ}\text{C}$  for

16 h. After 16 h, the whole mixture was poured over crushed ice (~ 250 g) and stirred for 20 min. Solid ammonium acetate was then added and the pH of the aqueous layer was checked from time to time. When the pH of the solution was ~ 7-8, the aqueous layer was repeatedly extracted with dichloromethane (3 x 75 ml). The dark yellow dichloromethane phase was washed (H<sub>2</sub>O, 50 ml), dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to leave a honey colored gum (3.58 g) which when chromatographed on a column of Silica gave yellow crystals of the bromoaldehyde (3.26 g, 97%) which was crystallized from hexane/EtoAC. M.p. 125°C.

#### 15 Preparation of Compound 29

To a well stirred solution of the bromoaldehyde (28) (4 g; 0.0125 mol) in MeOH (720 ml) was added NaBH<sub>4</sub> (400 mg) in small portions in such a way that the reaction was not too vigorous. After 45 min, the reaction mixture was stirred for a further 30 min and the MeOH was evaporated *in vacuo*. To the residue was added water (25 ml) and repeatedly extracted with dichloromethane (25 ml x 5). The dichloromethane phase was washed (sat. saline, 25 ml), dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a white solid, m.p. 114°C and was used as such for the next step without further purification and after drying over P<sub>2</sub>O<sub>5</sub> for 24 h (4.011 g; ~ 98%). The next step was carried out as described (Bose et al., 1973, Tet. Lett. 1619; Bose et al., 1973, Tet. Lett. 3937).

#### Preparation of Compound 30

##### Part A

To a solution of phthalimido derivative (29) (400 mg; 0.888 mmol) in THF/EtOH (7/14 ml) was added anhydrous hydrazine (0.5 ml, a known excess) and this

mix was heated to reflux on an oil bath at 90°C for 16-18 h. The THF and EtOH were removed in vacuo. To the residue was added dichloromethane (30 ml) and filtered to remove the phthaloyl hydrazide. The residue was washed twice (5 ml each) with dichloromethane. The combined dichloromethane phase was concentrated in vacuo to give a yellow oil (292 mg).

10

#### Part B

To a solution of the amine (300 mg; 0.9375 mmol), BOC<sub>2</sub>O (245.25 mg; 1.125 mmol), DMAP (30 mg) in THF (10 ml) in an atmosphere of N<sub>2</sub> with stirring was added Et<sub>3</sub>N (114.5 mg; 1.125 mmol). This reaction mixture was allowed to stir at r.t. for 16-18 h after which THF was removed in vacuo. To the residue was added water (15 ml) and repeatedly extracted with dichloromethane (15 ml x 3). The combined dichloromethane phase was washed (H<sub>2</sub>O, 10 ml), dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a pale yellow gum (552 mg) which was purified by column chromatography on Silica gel using hexane-ethyl acetate 5-7% to give a white microcrystalline powder, m.p. 172°C (306 mg; 78%).

25

#### Preparation of Compound 31

To a well cooled solution of the bromo derivative (30) (100 mg; 0.2381 mmol) in THF (5 ml) at -78°C was added  $\eta$ -BuLi (2.5 M in hexane; 0.19 ml; 0.4762 mmol; 2 equiv.). The solution turned yellow immediately and this was allowed to stir at -78°C for 10 min (care should be taken to keep the temperature of the anion below -40°C as this will deprotect the BOC group on the amine). Dry CO<sub>2</sub> gas was passed through this solution carefully for 15 min and the

30

35

solution was allowed to come to r.t. The reaction was quenched with crushed ice. THF was removed *in vacuo*. A saturated solution of  $\text{NaHCO}_3$  (5 ml) was added to the aqueous residue and washed with ether (2 x 5 ml). The aqueous layer was cooled in ice and acidified with conc. HCl to pH 2. The yellow precipitate was collected and washed with chilled water (2 x 5 ml), giving a yellow microcrystalline powder (66.17 mg; 72%).

#### 5.4. CHARACTERIZATION OF TAM MIMICS

In a preferred although optional aspect, TAM Mimics are further characterized as described below prior to *in vitro* and *in vivo* testing of inhibitory/therapeutic activity. The conformational preferences and membrane-penetrating properties of the TAM Mimic peptides can be investigated both theoretically and experimentally.

Membrane-penetrating properties of a TAM Mimic peptide can be predicted based on four parameters (Schwyzer et al., 1986, Helvetica Chimica Acta 69:1789-1797): (i) the free energy of hydrophobic association, (ii) the molecular amphiphilic moment; (iii) the electric dipole of the peptide; and (iv) the net charge of the peptide.

These four factors can be combined to predict the energy of association for a peptide segment in a particular orientation with a lipid bilayer possessing known charge characteristics. By searching for the minimum energy conformation, it is possible to predict the length of helix formed on association, and its orientation with respect to the bilayer surface. This approach can be used to predict the effect of sequence modification on the lipid

bilayer binding properties of a series of peptides.  
These predictions can be tested as described below.

The lipid-induced helix-forming potential of  
5 a TAM Mimic can be assessed by CD (circular dichroism)  
spectroscopy in the presence of lipid-mimicking  
solvents (e.g., trifluorethanol) and lipid vesicles.  
NMR (nuclear magnetic resonance) spectroscopy can be  
used to determine the three-dimensional structure of a  
10 TAM Mimic both in helix-promoting solvents and in the  
presence of liposomes.

NMR has been used extensively to study the  
three-dimensional structure of biologically active  
peptides in solution or bound to micelles or  
15 phospholipid vesicles. The use of NMR to study the  
solution conformation of proteins and peptides is well  
established (Wuthrich, K., 1986, *NMR of Proteins and  
Nucleic Acids*, John Wiley & Sons, Inc.) and similar  
NMR analyses have been applied to a number of peptide-  
20 bilayer systems.

The membrane transport properties of TAM  
Mimics can be studied by size exclusion  
chromatography. Lipid vesicles are prepared,  
incubated with TAM Mimics, then chromatographed to  
25 separate free TAM Mimic. The vesicle contents are  
then assayed to determine the amount of TAM Mimic  
present in the lipid vesicle fraction (determinable by  
HPLC or amino acid analysis). A fluorescence assay  
for peptide transport can be used; the assay uses a  
30 water-stable fluorogenic reagent that becomes trapped  
inside the vesicles during formation. This  
fluorogenic reagent reacts with TAM Mimic molecules  
that have crossed the lipid bilayer, producing a  
fluorescent derivative.

### 5.5. DEMONSTRATION OF THERAPEUTIC UTILITY

TAM Mimics are tested *in vitro* and then preferably *in vivo* for the desired therapeutic utility.

Any *in vitro* assay known in the art can be used to detect inhibition by a TAM Mimic of the invention. For example, in a preferred embodiment wherein a TAM Mimic inhibitory to mast cell or basophil activation is desired, a functional *in vitro* assay for mast cell or basophil degranulation is employed (see, e.g., Section 8 *infra*, and Barsumian et al., 1981, Eur. J. Immunol. 11:317-323; Cunha-Melo et al., 1989, J. Immunol. 143:2617-2625). The release of histamine, the release of beta-hexosaminidase, the release of cytokines (e.g., interleukins) and/or increased phosphatidylinositol hydrolysis or tyrosine phosphorylation can be detected in *in vitro* assays as indications of mast cell or basophil activation (see e.g., Stephan et al., 1992, J. Biol. Chem. 267:5434). Histamine release can be assayed, for example, by commercially available radioimmunoassay (e.g., AMAC Inc., Westbrook, Maine, Cat. No. 1302). Basophilic cell lines such as RBL-2H3 (Stephan et al., *supra*), KU812 (Matsson et al., 1989, Int. Arch. Allergy Appl. Immunol. 88:122-125; Valent et al., 1990, J. Immunol. 145:1885-1889), etc. can be employed in such *in vitro* assays. The release of histamine from basophils is an *in vitro* assay of immediate hypersensitivity (Ishizaka & Ishizaka, 1975, Prog. Allergy 19:60). Other specific examples of *in vitro* assays of activation of other cell types are as follows: Natural killer activation can be assayed, e.g., by *in vitro* cytotoxicity assays measuring natural killer lysis of target cells such as K562 erythromyeloid leukemia cells. Macrophage activation can be assayed by

measuring macrophage phagocytic activity, induction of macrophage cytotoxicity, or induction of macrophage Class II MHC cell surface expression, or by observing morphological changes associated with activation (see e.g., Wright and Meyer, 1985, J. Exp. Med. 162:762-767; Fidalgo and Najjar, 1967, Biochemistry 6(11):3386-3392; U.S. Patent No. 5,049,659 dated September 17, 1991). T cell activation can be assayed by T cell proliferation *in vitro*, or by measuring expression of cell surface interleukin-2 receptor (IL-2R), which increases upon activation of T cells (Waldman et al., 1984, J. Exp. Med. 160:1450-1466). B cell activation can be assayed by measuring B cell proliferation *in vitro*.

TAM Mimics demonstrated to have the desired activity *in vitro* can be tested *in vivo* for the desired inhibitory activity. For example, such compounds can be tested in suitable animal model systems prior to testing in humans, including but not limited to rats, mice, chicken, cows, monkeys, rabbits, etc. Suitable model systems are also used to demonstrate therapeutic utility (see *infra*).

For *in vivo* testing, prior to administration to humans, any animal model system known in the art may be used. For example, an animal model system for rheumatoid arthritis is that consisting of animals of the autoimmune MRL/l mouse strain (Murphy, E.D. and Roths, J.B., 1978, in Genetic Control of Autoimmune Disease, Rose, N.R., et al., eds., Elsevier/North-Holland, New York, pp. 207-219), that develop a spontaneous rheumatoid arthritis-like disease (Hang et al., 1982, J. Exp. Med. 155:1690-1701). There are numerous animal models of asthma that have been developed and can be used (for reviews, see Larson, 1991, "Experimental models of reversible airway

obstruction," in *The Lung: Scientific Foundations*, Crystal, West et al. (eds.), Raven Press, New York, pp. 953-965; Warner et al., 1990, *Am. Rev. Respir. Dis.* 141:253-257). Species used as animal models for  
5 asthma include mice, rats, guinea pigs, rabbits, ponies, dogs, sheep, and primates.

Many other *in vivo* models are available and can be used, e.g., as described in the following  
10 references:

Cross et al. (1990) Homing to central nervous system vasculature by antigen-specific lymphocytes. I. Localization of <sup>14</sup>C-labeled cells during acute, chronic, and relapsing experimental allergic  
15 encephalomyelitis. *Lab. Invest.* 63:162-170.

#### 5.6. THERAPEUTIC AND PROPHYLACTIC USES

The TAM Mimics have therapeutic and prophylactic utility in the modulation of functions mediated by MIRRs, in particular in diseases or disorders involving the immune system or inflammation (inflammatory and immune disorders). TAM Mimics which inhibit lymphocytes are important therapeutically, because lymphocytes initiate autoimmune and alloimmune diseases.

TAM Mimics which inhibit an immune or inflammatory response and thus are useful according to the invention are most preferably identified by use of known convenient *in vitro* assays, e.g., based on their ability to inhibit activation of cells of the immune system assayed *in vitro*, or *in vivo* assays (see Section 5.5 *supra*). TAM Mimics which inhibit activation of T cells, B cells, and/or macrophages *in vitro* are preferred for treatment (or prevention) of immune disorders such as but not limited to autoimmune diseases and transplant rejection. TAM Mimics which inhibit activation of macrophages and/or natural killer cells *in vitro* are preferred for treatment (or prevention) of immune complex diseases such as but not limited to glomerulonephritis and other autoimmune diseases. TAM Mimics which inhibit activation of mast cells *in vitro* are preferred for treatment (or prevention) of type I allergic (IgE-mediated) reactions such as but not limited to asthma and allergic rhinitis. Further descriptions of diseases

and disorders subject to treatment with TAM Mimics are described below.

The invention provides methods of treating  
5 or preventing diseases and disorders associated with undesirable or inappropriate immune system activity or inflammation by administration to a subject of an effective amount of a TAM Mimic of the invention.

The subject is preferably an animal,  
10 including but not limited to animals such as cows, pigs, chickens, etc., and is preferably a mammal, and most preferably human.

Diseases and disorders which can be treated by administration of a therapeutically effective  
15 amount of a TAM Mimic which inhibits the inflammatory/immune response include but are not limited to the following:

Inflammatory arthritis - e.g., rheumatoid arthritis, seronegative spondyloarthritides (Behcets  
20 disease, Reiter's syndrome, etc.), juvenile rheumatoid arthritis, vasculitis, psoriatic arthritis, polydermatomyositis.

Systemic lupus erythematosus (SLE).

Asthma.

Inflammatory dermatoses - e.g., psoriasis,  
25 dermatitis herpetiformis, eczema, necrotizing and cutaneous vasculitis, bullous diseases.

Inflammatory bowel disease - Crohn's disease and ulcerative colitis.

Tissue damage relating to tissue  
30 transplantation.

Other autoimmune disorders. In addition to the autoimmune disorders SLE and rheumatoid arthritis, disorders such as glomerulonephritis, juvenile onset  
35 diabetes, multiple sclerosis, allergic conditions, autoimmune thyroiditis, allograft rejection (e.g.,

rejection of transplanted organs such as kidney, heart, pancreas, bowel, or liver), and graft-versus-host disease can be treated.

5 In addition, other diseases and clinical correlates of undesirable inflammatory responses can be treated with inhibitor TAM Mimics of the invention, including but not limited to those associated with hemolytic anemia, blood transfusion, certain  
10 hematologic malignancies, scleroderma, atherosclerosis, cytokine-induced toxicity, necrotizing enterocolitis, granulocyte-transfusion-associated syndromes, Reynaud's syndrome, or other central nervous system inflammatory disorders.

15 Furthermore, in a preferred aspect of the invention, a TAM Mimic which inhibits mast cell activation is administered to treat (or prevent) a type I allergic reaction such as one or more of the following listed in Table 1 (see generally, Terr,  
20 1987, in *Basic & Clinical Immunology*, 6th Ed., ch. 24, Stites et al. (eds), Appleton & Lange, Norwalk, Connecticut, pp. 435-456).

25

30

35

TABLE 1

Atopic Diseases

- 5                   •     allergic rhinitis (hay fever) - e.g.,  
                            due to pollens, fungal spores, dust,  
                            animal dander
- asthma
- atopic dermatitis
- 10                  •     allergic gastroenteropathy (due to  
                            ingested food)

- 15                  Anaphylaxis (a systemic immediate  
                            hypersensitivity affecting multiple organs),  
                            e.g. due to drugs (proteins such as in  
                            vaccines, and nonproteins such as  
                            antibiotics, anesthetics, salicylates),  
                            foods, venom of stinging insects)

Urticaria or Angioedema (increased cutaneous  
                            vascular permeability)

20

5.7.    THERAPEUTIC/PROPHYLACTIC  
          ADMINISTRATION AND COMPOSITIONS

The invention provides methods of treatment  
(and prophylaxis) by administration to a subject of an  
25 effective amount of a TAM Mimic of the invention. In  
a preferred aspect, the TAM Mimic is purified. The  
subject is preferably an animal, including but not  
limited to animals such as cows, pigs, chickens, etc.,  
and is preferably a mammal, and most preferably human.

30                  Various delivery systems are known and can  
be used to administer a TAM Mimic of the invention,  
e.g., encapsulation in liposomes, microparticles,  
microcapsules, expression by recombinant cells,  
receptor-mediated endocytosis (see, e.g., Wu and Wu,  
35 1987, J. Biol. Chem. 262:4429-4432), construction of a  
TAM Mimic-encoding nucleic acid as part of a

retroviral or other vector, etc. Since preferred TAM Mimics of the invention are permeable to the cell membrane, a preferred mode of delivery is via pulmonary administration, as detailed more fully in Section 5.7.1 *infra*. However, methods of introduction include but are not limited to intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous, intranasal, epidural, and oral routes. The TAM Mimics may be administered by any convenient route, for example by infusion or bolus injection, by absorption through epithelial or mucocutaneous linings (e.g., oral mucosa, rectal and intestinal mucosa, etc.) and may be administered together with other biologically active agents. Administration can be systemic or local. For TAM Mimics which are used for inhibition of mast cell activation, e.g., for therapy of asthma or allergy, the preferred route of administration is nasal or via a bronchial aerosol.

In a specific embodiment, it may be desirable to administer the TAM Mimics of the invention locally to the area in need of treatment; this may be achieved by, for example, and not by way of limitation, local infusion during surgery, topical application (e.g., for skin conditions such as psoriasis), by injection, by means of a catheter, by means of a suppository, or by means of an implant, said implant being of a porous, non-porous, or gelatinous material, including membranes, such as sialastic membranes, or fibers.

The present invention also provides pharmaceutical compositions. Such compositions comprise a therapeutically (or prophylactically) effective amount of a TAM Mimic, and a pharmaceutically acceptable carrier or excipient. Such a carrier includes but is not limited to saline,

buffered saline, dextrose, water, glycerol, ethanol, and combinations thereof. The carrier and composition can be sterile. The formulation should suit the mode  
5 of administration.

The composition, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents. The composition can be a liquid solution, suspension, emulsion, tablet,  
10 pill, capsule, sustained release formulation, or powder. The composition can be formulated as a suppository, with traditional binders and carriers such as triglycerides. Oral formulation can include standard carriers such as pharmaceutical grades of  
15 mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, etc.

In a specific embodiment, the composition is formulated in accordance with routine procedures as a pharmaceutical composition adapted for intravenous  
20 administration to human beings. Typically, compositions for intravenous administration are solutions in sterile isotonic aqueous buffer. Where necessary, the composition may also include a solubilizing agent and a local anesthetic to ease pain  
25 at the site of the injection. Generally, the ingredients are supplied either separately or mixed together in unit dosage form, for example, as a dry lyophilized powder or water free concentrate in a hermetically sealed container such as an ampoule or  
30 sachette indicating the quantity of active agent. Where the composition is to be administered by infusion, it can be dispensed with an infusion bottle containing sterile pharmaceutical grade water or saline. Where the composition is administered by  
35 injection, an ampoule of sterile water for injection

or saline can be provided so that the ingredients may be mixed prior to administration.

The TAM Mimics of the invention can be formulated as neutral or salt forms. Pharmaceutically acceptable salts include those formed with free amino groups such as those derived from hydrochloric, phosphoric, acetic, oxalic, tartaric acids, etc., and those formed with free carboxyl groups such as those derived from sodium, potassium, ammonium, calcium, ferric hydroxides, isopropylamine, triethylamine, 2-ethylamino ethanol, histidine, procaine, etc.

The amount of the TAM Mimic of the invention which will be effective in the treatment of a particular disorder or condition will depend on the nature of the disorder or condition, and can be determined by standard clinical techniques. In addition, *in vitro* or *in vivo* assays may optionally be employed to help identify optimal dosage ranges. The precise dose to be employed in the formulation will also depend on the route of administration, and the seriousness of the disease or disorder, and should be decided according to the judgment of the practitioner and each patient's circumstances. Effective doses may be extrapolated from dose-response curves derived from *in vitro* or animal model test systems.

The invention also provides a pharmaceutical pack or kit comprising one or more containers filled with one or more of the ingredients of the pharmaceutical compositions of the invention. Optionally associated with such container(s) can be a notice in the form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceuticals or biological products, which notice reflects approval by the agency of manufacture, use or sale for human administration.

5.7.1. PULMONARY ADMINISTRATION

In a preferred embodiment of the invention, a TAM Mimic is administered by pulmonary administration. In particular, a bronchial aerosol is employed. This mode of administration is particularly preferred where the TAM Mimic inhibits mast cell activation and thus is useful in treating IgE-related disorders. Thus, pulmonary administration is preferred for treatment, e.g., of allergy or asthma.

Pulmonary administration can be accomplished, for example, using any of various delivery devices known in the art (see e.g., Newman, S.P., 1984, in *Aerosols and the Lung*, Clarke and Davia (eds.), Butterworths, London, England, pp. 197-224; PCT Publication No. WO 92/16192 dated October 1, 1992; PCT Publication No. WO 91/08760 dated June 27, 1991; NTIS Patent Application 7-504-047 filed April 3, 1990 by Roosdorp and Crystal), including but not limited to nebulizers, metered dose inhalers, and powder inhalers. Various delivery devices are commercially available and can be employed, e.g., Ultravent nebulizer (Mallinckrodt, Inc., St. Louis, Missouri); Acorn II nebulizer (Marquest Medical Products, Englewood, Colorado), Ventolin metered dose inhaler (Glaxo Inc., Research Triangle Park, North Carolina); Spinhaler powder inhaler (Fisons Corp., Bedford, Massachusetts). Such devices typically entail the use of formulations suitable for dispensing from such a device, in which a propellant material may be present.

Ultrasonic nebulizers tend to be more efficient than jet nebulizers in producing an aerosol of respirable size from a liquid (Smith and Spino, "Pharmacokinetics of Drugs in Cystic Fibrosis," Consensus Conference, Clinical Outcomes for Evaluation

- 46 -

of New CF Therapies, Rockville, Maryland, December 10-11, 1992, Cystic Fibrosis Foundation).

A nebulizer may be used to produce aerosol particles, or any of various physiologically acceptable inert gases may be used as an aerosolizing agent. Other components such as physiologically acceptable surfactants (e.g., glycerides), excipients (e.g., lactose), carriers, and diluents may also be included.

#### 6. SYNTHESIS OF 19-MER TAM MIMICS

Five different 19-mer Tam Mimic peptides were synthesized, as described *infra*. The five peptides had the following sequences, and were termed respectively TAM-1, TAM-2, TAM-4, TAM-5, and TAM-6:

Ac-D G V Y T G L S T R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:19);

Ac-Q K V Y D K L L K R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:20);

Ac-Q K V Y C K L L C R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID NO:22);

Ac-D G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID NO:23); and

Ac-N G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID NO:24).

30

#### 6.1. SYNTHESIS OF PEPTIDES

##### 6.1.1. GENERAL PROCEDURES FOR SOLID PHASE SYNTHESIS

Peptides were synthesized on an Applied Biosystems Inc. ("ABI") model 431A automated peptide synthesizer using the "Fastmoc" synthesis protocol supplied by ABI, which uses

2-(1H-Benzotriazol-1-yl)-1,1,3,3,-tetramethyluronium hexafluorophosphate ("HBTU") (R. Knorr et al., 1989, Tet. Lett., 30:1927) as coupling agent. Syntheses were carried out on 0.25 mmol of commercially available 4-(2',4'-dimethoxyphenyl-(9-fluorenyl-methoxycarbonyl)-aminomethyl)-phenoxy polystyrene resin ("Rink resin" from Advanced ChemTech) (H. Rink, 1987, Tet. Lett. 28:3787). Fmoc amino acids (1 mmol) were coupled according to the Fastmoc protocol. The following side chain protected Fmoc amino acid derivatives were used: FmocArg(Pmc)OH; FmocAsn(Mbh)OH; FmocAsp('Bu)OH; FmocCys(Acm)OH; FmocGlu('Bu)OH; FmocGln(Mbh)OH; FmocHis(Tr)OH; FmocLys(Boc)OH; FmocSer('Bu)OH; FmocThr('Bu)OH; FmocTyr('Bu)OH. [Abbreviations: Acm, acetamidomethyl; Boc, tert-butoxycarbonyl; 'Bu, tert-butyl; Fmoc, 9-fluorenylmethoxycarbonyl; Mbh, 4,4'-dimethoxybenzhydryl; Pmc, 2,2,5,7,8-pentamethylchroman-6-sulfonyl; Tr, trityl].

Synthesis is carried out using N-methylpyrrolidone (NMP) as solvent, with HBTU dissolved in N,N-dimethylformamide (DMF). Deprotection of the Fmoc group is effected using ca. 20% piperidine in NMP. At the end of each synthesis the amount of peptide present is assayed by ultraviolet spectroscopy. A sample of dry peptide resin (ca. 3-10 mg) is weighed, then 20% piperidine in DMA (10 mL) is added. After 30 min sonication, the UV (ultraviolet) absorbance of the dibenzofulvene-piperidine adduct (formed by cleavage of the N-terminal Fmoc group) is recorded at 301 nm. Peptide substitution (in mmol g<sup>-1</sup>) can be calculated according to the equation:

$$\text{substitution} = \frac{A \times v}{7800 \times w} \times 1000$$

where A is the absorbance at 301 nm, v is the volume of 20% piperidine in DMA (in mL), 7800 is the extinction coefficient (in  $\text{mol}^{-1}\text{dm}^3\text{cm}^{-1}$ ) of the dibenzofulvene-piperidine adduct, and w is the weight of the peptide-resin sample (in mg).

Finally, the N-terminal Fmoc group is cleaved using 20% piperidine in DMA, then acetylated using acetic anhydride and pyridine in DMA. The peptide resin is thoroughly washed with DMA,  $\text{CH}_2\text{Cl}_2$ , and finally diethyl ether.

#### 6.1.2. CLEAVAGE AND DEPROTECTION -- GENERAL PROCEDURE

The air-dried peptide resin is treated with ethylmethyl-sulfide (EtSMe), ethanedithiol (EDT), and thioanisole (PhSMe) for approximately 20 min. prior to addition of 95% aqueous trifluoroacetic acid (TFA). A total volume of ca. 50 mL of these reagents are used per gram of peptide-resin. The following ratio is used: TFA : EtSMe : EDT : PhSMe (10 : 0.5 : 0.5 : 0.5). The mixture is stirred for 3 h at room temperature under an atmosphere of  $\text{N}_2$ . The mixture is filtered and the resin washed with TFA (2 x 3 mL). The combined filtrate is evaporated in vacuo, and anhydrous diethyl ether added to the yellow/orange residue. The resulting white precipitate is isolated by filtration.

#### 6.2. TAM-1 PEPTIDE

The following 19-mer TAM Mimic peptide, termed "TAM-1", having the TAM native sequence shown was synthesized:

Ac-D G V Y T G L S T R N Q E T Y E T L K-NH<sub>2</sub>  
(SEQ ID NO:19).

### 6.2.1. SYNTHESIS

Synthesis was carried out according to the procedure detailed in Section 6.1.1. UV analysis following the final coupling of FmocAsp('Bu)OH to the peptide-resin revealed a substitution of 0.147 mmol g<sup>-1</sup> (0.194 mmol g<sup>-1</sup> is theoretically predicted, based on an initial resin substitution of 0.62 mmol g<sup>-1</sup>). The peptide-resin was subsequently acetylated (see Section 6.1.1) and 600 mg of the peptide-resin was cleaved and deprotected in accordance with the procedure described in Section 6.1.2.

### 6.2.2. PURIFICATION OF Ac-(TAM-1)-NH<sub>2</sub>

The crude Ac-(TAM-1)-NH<sub>2</sub> (276 mg) was partially purified by gel filtration in 10% aqueous acetic acid on Sephadex G-10 (column 2.5 cm x 40 cm). Product-containing fractions were pooled and lyophilized to give 152 mg material which was further purified by reversed phase HPLC on a Vydac C18 column (25 x 250 mm) to give 52 mg of >90% pure peptide.

### 6.3. TAM-2 PEPTIDE

The following TAM Mimic peptide, termed TAM-2, was synthesized:  
Ac-Q K V Y D K L L K R N Q E T Y E T L K-NH<sub>2</sub>  
(SEQ ID NO:20). Non-consensus amino acids were changed relative to the TAM-1 peptide sequence, with a view toward achieving a higher degree of helicity.

### 6.3.1. SYNTHESIS

Synthesis was carried out by the methods described in Section 6.1.1.

#### 6.4. TAM-4 PEPTIDE

The following TAM Mimic peptide, termed TAM-4, was synthesized:

- 5 AC-Q K V Y C K L L C R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID NO:22). The peptide contained two cysteine residues linked via a disulfide bridge to help lock the peptide into the presumed desired conformation.

##### 10 6.4.1. SYNTHESIS

Synthesis was carried out according to the methods described in Section 6.1.1, then 766 mg of the peptide-resin was cleaved and deprotected as described in Section 6.1.2 to give 385 mg of crude peptide.

##### 15 6.4.2. PURIFICATION, CYCLIZATION AND ISOLATION OF TAM-4 PEPTIDE

- The crude peptide (385 mg) was initially partially purified by gel filtration on Sephadex G-10 eluted with 10% aqueous acetic acid to give 300 mg material. Peptide (73 mg) was dissolved in degassed 50% aqueous acetic acid (2.5 mL) and mercuric acetate (91 mg) in 50% aqueous acetic acid (1.0 mL) was added. The mixture was stirred under N<sub>2</sub> for 3 h, then  $\beta$ -mercaptoethanol (300  $\mu$ L) was added and the mixture stirred overnight. The grey precipitate was separated by centrifugation and the supernatant desalted on a Sephadex G-10 column eluted with 10% aqueous acetic acid under an atmosphere of N<sub>2</sub>. Desired fractions were pooled and lyophilized. The peptide (62 mg) was reduced by dissolution in 6 M urea/0.2 M tris(trihydroxymethyl)aminomethane-HCl buffer pH 8 (3 mL), followed by addition of dithiothreitol (40 mg) in the same buffer (1 mL). The mixture was stirred in the dark for 3 h under an atmosphere of N<sub>2</sub>. The sample was desalted on a Sephadex G-10 column eluted with 1 M

NH<sub>4</sub>HCO<sub>3</sub>, pH 8 buffer under an atmosphere of N<sub>2</sub>. Relevant column fractions were combined, diluted to a total volume of 620 mL (i.e., 0.1 mg ml<sup>-1</sup>) with 1 M NH<sub>4</sub>HCO<sub>3</sub>,  
5 and stirred vigorously in air for 66 h. The sample was then lyophilized and subsequently desalted on Sephadex G-10 eluted with 10% aqueous AcOH to give 35 mg of product. Further purification was carried out by HPLC on a Kromasil C8 100 Å column (20 x 250  
10 mm, eluted with a gradient of 30-50% MeCN in H<sub>2</sub>O (0.1% TFA). Purified product was 10.5 mg.

#### 6.5. TAM-5 PEPTIDE

The following TAM Mimic peptide, termed  
15 TAM-5 was synthesized:  
Ac-D G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub>  
(SEQ ID NO:23). In this sequence the two glutamate residues of the native sequence (TAM-1) are replaced by lysine.

20

##### 6.5.1. SYNTHESIS

Synthesis was carried out as described in Section 6.1.1. UV analysis of the peptide-resin following coupling of FmocAsp('Bu) revealed a  
25 substitution of 0.138 mmol g<sup>-1</sup> (compared to 0.191 mmol g<sup>-1</sup> predicted from an initial resin substitution of 0.62 mmol g<sup>-1</sup>). The peptide-resin was acetylated (Section 6.1.1), then 466 mg was cleaved and deprotected as described in Section 6.1.2 to afford  
30 400 mg crude material. Purification of 49 mg crude peptide on reversed-phase HPLC (Kromasil C8, 100 Å, 10 µ particle size, 20 x 250 mm column) using a gradient of MeCN in H<sub>2</sub>O (0.1% TFA) gave 21 mg of the desired product.

35

#### 6.6. TAM-6 PEPTIDE

The following TAM Mimic peptide, termed TAM-6 was synthesized:

- 5 Ac-N G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub>  
(SEQ ID NO:24). In this sequence the aspartate residue of the native sequence (TAM-1) is replaced by asparagine, and the two glutamate residues are replaced by lysine; thus all acidic amino acids are  
10 substituted.

#### 6.6.1. SYNTHESIS

- Synthesis was carried out as described in Section 6.1.1. UV analysis of the peptide resin  
15 following coupling of FmocAsn(Mbh)OH revealed a substitution of 0.109 mmol g<sup>-1</sup> (compared to a predicted value of 0.185 mmol g<sup>-1</sup> from an initial resin substitution of 0.62 mmol g<sup>-1</sup>). The peptide-resin was acetylated (Section 6.1.1), then 358 mg peptide-resin  
20 was cleaved and deprotected as described in Section 6.1.2 to give 199 mg of crude product. Crude peptide (153 mg) was purified by reversed-phase HPLC on a column packed with Kromasil C8, 100 Å, 10 µ particle size (20 x 250 mm) eluted with a gradient of MeCN in  
25 H<sub>2</sub>O (0.1% TFA) to give 38 mg of the desired peptide, TAM-6.

#### 7. SECONDARY STRUCTURE DETERMINATION OF TAM-1

- The synthesized and purified TAM-1 (see  
30 Section 6.1) was subjected to nuclear magnetic resonance (NMR) spectroscopy, which allowed the determination of its secondary structure and appropriate templates for helix nucleation in the formation of peptide hybrids (see Section 5.2).

- 35 To carry out the NMR spectroscopy, the purified TAM-1 was prepared both as a 3 mM solution in

30% (v/v) deuterated trifluoroethanol (30% TFE) and as a 3 mM solution in the presence of deuterated dodecylphosphatidylcholine (DPC) micelles. NMR spectra were acquired using 600 MHz NMR spectrometers (Bruker AMX600). A series of two-dimensional spectra were obtained for each sample (DQF-COSY, HOHAHA and NOESY experiments), and the NMR spectra for both samples were assigned using standard sequential assignment methodologies (Wuthrich K., 1986, NMR of Proteins and Nucleic Acids, John Wiley and Sons, Inc.).

The NMR analysis of the secondary structure of the TAM-1 peptides was based on an analysis of the relative intensities of interproton NOE data (Wuthrich K., 1986, NMR of Proteins and Nucleic Acids, John Wiley and Sons, Inc.) and a chemical shift index analysis (Wishart et al., 1992, Biochem. 31:1647-1651).

For both samples of TAM-1 sequential and medium range NOE peak intensities indicated that a helical structure is present in the C-terminal portion of the molecule.

The results of the chemical shift index analysis were as follows:

30

35

	Residue	30% TFE Score	DPC Score
	Asp 1	-	-
5	Gly 2	0	0
	Val 3	0	0
	Tyr 4	0	0
	Thr 5	-1	-1
10	Gly 6	-1	-1
	Leu 7	+1	+1
	Ser 8	-1	-1
	Thr 9	-1	-1
	Arg 10	-1	-1
15	Asn 11	-1	-1
	Gln 12	-1	-1
	Glu 13	-1	-1
	Thr 14	-1	-1
20	Tyr 15	-1	-1
	Glu 16	-1	-1
	Thr 17	-1	-1
	Leu 18	0	0
25	Lys 19	-	-

An extended sequence of -1 scores in the chemical shift index analysis implies that a helical conformation is present in the peptide. The chemical shift index analysis results above are both self-consistent and consistent with the analysis of the NOE data. Taken together the analyses imply that the peptide exists in a predominantly helical conformation in both solvent systems. Such a helical conformation contains three turns, with the conserved Tyr and Leu residues from the motif stacked on the same side of the molecule. We propose that the face

- 55 -

of the helix that contains the conserved amino acids is the functionally important side and that the other side of the helix can accommodate structural changes.

5

## 8. MAST CELL/BASOPHIL DEGRANULATION ASSAYS

### 8.1. INTACT CELL ASSAYS

The release of  $\beta$ -hexosaminidase from basophils is measured as an *in vitro* assay of basophil activation. A cell line, RBL-2H3 (from the laboratory of Dr. Siraganian, National Institutes of Health), of rat basophilic leukemia (RBL) cells is used in such an *in vitro* assay, according to the protocol described below (see also Barsumian et al., 1981, Eur. J. Immunol. 11:317-323). The percentage of  $\beta$ -hexosaminidase in cells that is released into the cell medium is determined, and is a measure of the activation of the RBL-2H3 cells.

20

#### 8.1.1. ACTIVATION OF RBL-2H3 CELLS

##### Materials

- RBL medium containing 2% fetal bovine serum (FBS)

25

100 ml E-MEM  
2 ml FBS  
1 ml glutamine  
1.2 ml penicillin-streptomycin

30

filter sterilize into sterile bottles or tissue culture flasks and store at 4°C

- 10x PIPES buffer

35

75.6 g PIPES (0.25 M)  
69.2 g NaCl (1.2 M)

- 56 -

3.72 g KCl (0.05 M)  
43 ml of 10 N NaOH (0.4 M)  
Add water to 1000 ml

5

filter sterilize into sterile bottles or  
tissue culture flasks and store at 4°C

- 100x calcium chloride

10

1.47 g  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$  (100 mM)  
Add water to 100 ml

15

filter sterilize into sterile bottles or  
tissue culture flasks and store at 4°C

- 2x-IgE (anti DNP-IgE mouse monoclonal  
antibody; Zymed) in regular RBL medium  
containing 15% FBS

20

Need 0.5 ml at 2-times an appropriate final  
dilution for each 16 mm well to be seeded  
with cells

25

- 1x PIPES+glucose+calcium (prepare fresh on  
second day of assay)

30

10 ml of 10X PIPES  
0.1 g glucose (dextrose) (5.6 Mm)  
0.1 g bovine serum albumin (BSA)  
1 ml of 100x calcium chloride

Add water to 90 ml; pH to 7.4; milli-Q water  
to 100 ml

35

Method

- 5       • Remove RBL cells from flasks by trypsin-EDTA treatment (see protocol *infra*). Plan to use  $1 \times 10^5$  cells/16 mm well to be seeded; harvest extra cells to allow for losses during centrifugation.
- 10       • Centrifuge the RBL cells and resuspend in 5 ml of regular RBL medium containing 15% FBS. Count the cells and dilute them to  $2 \times 10^5$  cells/ml in the same medium.
- 15       • For each well to be seeded, mix 0.5 ml of cells with 0.5 ml of 2x-IgE.
- Seed 1 ml of IgE-RBL per 16 mm well.
- 20       • Incubate plate(s) overnight at 37°C/5% CO<sub>2</sub>.
- Next day, dilute the DNP-HSA (dinitrophenol-human serum albumin; Calbiochem) to an appropriate dilution in 1x PIPES+glucose+calcium; 0.5 ml will be needed for each well.
- 25       • Remove the plate(s) from the incubator and aspirate the media from the wells.
- 30       • Add 2 ml of 1X PIPES+glucose+calcium to each well and aspirate again.
- Repeat the last step.
- 35

- 58 -

- Add the 0.5 ml of diluted DNP-BSA (or 1x PIPES+glucose+calcium alone as the negative control in triplicate) to wells.
- 5 • Incubate 40 min at 37°C/5% CO<sub>2</sub>.
- Meanwhile, label 12 x 75 tubes (round or conical bottom) to receive each supernatant and the cells themselves from the triplicate negative controls; also label 12 x 75 tubes for the beta-hexosaminidase assay.
- 10 • After the incubation, carefully transfer each supernatant from the 16 mm wells to appropriate tubes on ice.
- 15 • Add 250 µl of enzyme-free cell dissociation solution (Enzyme Free Cell Dissociation Solution Hank's Balanced Salts Based Formulation, Specialty Media Inc., Lavallette, NJ) to each of the triplicate negative control wells and incubate 5 min at 37°C.
- 20 • Transfer the 250 µl aliquots to conical bottom centrifuge tubes. Add 250 µl of PIPES+glucose+calcium to rinse each well and transfer to the appropriate tubes.
- 25 • Spin tubes 5 min at 1000 rpm and remove supernatants. Resuspend each in 500 µl of PIPES+glucose+calcium.
- 30 • Sonicate cell suspensions on ice (5 pulses); if no probe sonifier is available, freeze
- 35

- 59 -

thaw cells 3x using a methanol or ethanol-dry ice bath and a 37°C water bath.

- 5       •     Transfer 100 µl of each supernatant or cell lysate to a 12 x 75 tube and proceed with the beta-hexosaminidase ("beta-hex") assay protocol.

10     Protocol for Removing RBL Cells from Flasks

- Prepare trypsin/EDTA by diluting stock 1:10 in HBSS--; filter sterilize.
- Aspirate the medium from a flask of cells.
- 15     •     Add 10 ml of HBSS-- and gently rinse the flask.
- Aspirate the HBSS--.
- 20     •     Add 3 ml of trypsin/EDTA and incubate 5 min at 37°C.
- Rap the flask several times to loosen the cells.
- 25     •     Transfer the 3 ml to a tube.
- Rinse flask with 10 ml of the above medium and pool to the tube.
- 30

8.1.2.   BETA-HEXOSAMINIDASE ASSAY

Materials

- 35   1.   Beta-hex buffer

- 60 -

Solution 1: 0.2 M  $\text{Na}_2\text{PO}_4$  (sodium phosphate dibasic ANHYDROUS) - 14.2 g/500 ml distilled  $\text{H}_2\text{O}$

5            Note: If there is no anhydrous, use the sodium phosphate dibasic HEPTAHYDRATE ( $7\text{H}_2\text{O}$ ), but use 26.7 grams.

10           Solution 2: 0.4 M citric acid monohydrate - 42.1 g/ 500 ml distilled  $\text{H}_2\text{O}$

15           Mix approximately 70 ml of solution 1 with approximately 20 ml solution 2 until the pH is 4.5 (use solution 1 to raise the pH and solution 2 to lower it)

2.    Beta-hex cocktail

20           Beta-hex buffer (from above): 90 ml

Distilled  $\text{H}_2\text{O}$ : 135 ml

25           p-nitrophenyl-N-acetyl-beta-D-glucosaminide (p-nitrophenyl-beta-D-2-acetamide-2-deoxy-beta-D-glucopyranoside) (Sigma N-9376): 300 mg (0.30 g); stored at  $-20^\circ\text{C}$

Mix until dissolved

30           Aliquot in 15 ml tubes, label, date, and freeze at  $-20^\circ\text{C}$ .

3.    Beta-hex STOP solution

35           glycine: 15.0 g/ liter

- 61 -

bring to pH 10.7 with 10 N NaOH (will need to add  
~30 ml of NaOH)

5

Method

1. Place 100  $\mu$ l of sample in each 12 x 75 polystyrene round-bottom tube.
- 10 2. Add 400  $\mu$ l of beta-hex cocktail to each tube.
3. Cover with tin foil and incubate tubes 30 min at 37°C.
- 15 4. Add 1.5 ml of beta-hex stop to each tube.
5. Turn on the spectrophotometer and allow it to warm up 10 minutes.
- 20 6. Turn on the vacuum pump attached to the spectrophotometer.
7. Set the wavelength for 410 nm.
- 25 8. Aspirate any liquid in the spectrophotometer tubing.
9. Zero the spectrophotometer using beta-hex stop solution.
- 30 10. Aspirate the liquid from the tubing; double check reading with more beta-hex stop.
- 35 11. Aspirate the liquid from the tubing; read the absorbance at 410 nm ( $A_{410}$ ) of each sample within

- 62 -

one hour, remembering to aspirate the sample from the tubing between each one.

5

### 8.1.3. CALCULATION OF RESULTS

Determine the total beta-hex present in the RBL cells by adding the supernatant (S) and cell lysate (C) values for each of the triplicate negative controls and determine the mean [S+C].

10

Determine the % release for each supernatant by taking the beta-hex value and dividing by (S+C) x 100.

15

Determine the net % release by subtracting the % release value for the control from each % release value where DNP-BSA was added.

20

### 8.2. PERMEABILIZED CELL ASSAYS

The mast cell/basophil degranulation assay can also be performed using permeabilized cells, according to the protocol described below (see also Cunha-Melo et al., 1989, J. Immunol. 143:2617-2625; Ali et al., 1989, J. Immunol. 143:2626-2633; Ali et al., 1989, Biochim. Biophys. Acta 1010:88-99).

25

#### 8.2.1. PROTOCOL FOR PERMEABILIZATION OF RBL-2H3 CELLS WITH STREPTOLYSIN O

30

##### (1) Buffer:

Potassium glutamate	138.7 mM
Glucose	5 mM
Potassium salt of PIPES	20 mM
Magnesium Acetate	7 mM

35

- 63 -

Make 1 litre of the above buffer, do not adjust pH, sterile filter and store at 4°C until use.

- 5 At the time of use, remove appropriate volume and add the following:

1 M EGTA to give final concentration of 1 mM.

ATP (Sigma #A2383) to a final concentration of 5 mM.

- 10 Add  $\text{CaCl}_2$  (1 M) to a final concentration of 0.213 mM.

In the presence of 1 mM EGTA the free  $[\text{Ca}^{2+}]$  is 100 nM.

Adjust pH to 7.0.

BSA (1 mg/ml) optional.

$\text{LiCl}$  (10 to 20 mM) for phosphoinositide hydrolysis

- 15 experiments.

#### (2) Streptolysin O

Streptolysin O reduced (Burrough's Wellcome; catalog #MR 16).

20

Add 4 ml  $\text{H}_2\text{O}$  to 40 I.U. of streptolysin O. (10 units/ml). Make aliquots and freeze immediately.

#### (3) Permeabilization

- 25 RBL-2H3 cells ( $0.2 \times 10^6$ / well, in growth medium) are plated in 24 well tissue culture plate and incubated overnight.

- The following day, cells are washed twice with  
30 potassium glutamate (KG) buffer (500  $\mu\text{l}$ ).

- The cells are permeabilized by exposure to streptolysin O (0.1 to 0.3 units/ml, 200-500  $\mu\text{l}$ /well) for 5 to 10 min. The concentration of streptolysin O  
35 and the time required for permeabilization depends on the number of passages the cells have been cultured

- 64 -

for and may vary with batch of streptolysin O. A useful starting point is to permeabilize cells with 0.25 I.U./ml streptolysin for 10 min.

- 5 Streptolysin O solution is prepared just before permeabilization by dilution of the stock solution (10 I.U./ml) into prewarmed KG buffer.
- 10 After the cells are permeabilized, remove buffer by aspiration, add fresh buffer (without toxin) and perform experiment as desired to measure cell activation (e.g., measure phosphoinositide hydrolysis, or  $\beta$ -hexosaminidase or histamine release).
- 15 Modifications of the permeabilization procedure can be made for measuring degranulation.

- The present invention is not to be limited in scope by the specific embodiments described herein.
- 20 Indeed, various modifications of the invention in addition to those described herein will become apparent to those skilled in the art from the foregoing description and accompanying figures. Such modifications are intended to fall within the scope of
- 25 the appended claims.

Various publications are cited herein, the disclosures of which are incorporated by reference in their entireties.

WHAT IS CLAIMED IS:

1. A peptide having an amino acid sequence  
 5 in the range of 15-39 amino acids, and comprising the amino acid sequence  
 (D/E)XXXXXXXX(D/E)XXYXXLXXXXXXXXYXX(L/I) (SEQ ID NO:1),  
 wherein X is any amino acid.
- 10 2. A peptide having an amino acid sequence in the range of 15-39 amino acids, and comprising the amino acid sequence (D/E)XXYXXLXXXXXXXXYXX(L/I)X (part of SEQ ID NO:1), wherein X is any amino acid.
- 15 3. A peptide having an amino acid sequence in the range of 15-39 amino acids, and comprising an amino acid sequence selected from the group consisting of: D G G Y M T L N P R A P T D D D K N T Y L T L P  
 (part of SEQ ID NO:2); D A V Y T G L S T R N Q E T Y E  
 20 T L K (part of SEQ ID NO:3); D R L Y E E L H V Y S P I  
 Y S A L E (part of SEQ ID NO:4); D Q L Y Q P L K D R E  
 D D Q Y S H L Q (part of SEQ ID NO:5); D Q V Y Q P L R  
 D R D D A Q Y S H L G (part of SEQ ID NO:6); D G L Y Q  
 G L S T A T K D T D A L H (part of SEQ ID NO:7, 8); E  
 25 N L Y E G L N L D D C S M Y E D I S (part of SEQ ID  
 NO:9, 10); D H T Y E G L N I D Q T A T Y E D I V (part  
 of SEQ ID NO:11); and E H T Y E G L N I D Q T A T Y E  
 D I V (part of SEQ ID NO:12).
- 30 4. A peptide having an amino acid sequence in the range of 15-39 amino acids, and comprising an amino acid sequence selected from the group consisting of: D G V Y T G L S T R N Q E T Y E T L K (SEQ ID  
 NO:13); Q K V Y D K L L K R N Q E T Y E T L K (SEQ ID  
 35 NO:14); Q K V Y D K L L K R N Q E L Y E T L K (SEQ ID  
 NO:15); Q K V Y C K L L C R N Q E L Y E T L K (SEQ ID

NO:16); and D G V Y T G L S T R N Q K T Y K T L K (SEQ ID NO:17); and N G V Y T G L S T R N Q K T Y K T L K (SEQ ID NO:18).

5

5. A peptide having 19 amino acids, and having the following amino acid sequence: D G V Y T G L S T R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:19).

10

6. A peptide having 19 amino acids, and having the following amino acid sequence: Q K V Y D K L L K R N Q E T Y E T L K-NH<sub>2</sub> (SEQ ID NO:20).

15

7. A peptide having 19 amino acids, and having the following amino acid sequence: Q K V Y D K L L K R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID NO:21).

20

8. A peptide having 19 amino acids, and having the following sequence: Q K V Y C K L L C R N Q E L Y E T L K-NH<sub>2</sub> (SEQ ID NO:22).

25

9. A peptide having 19 amino acids, and having the following sequence: D G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID NO:23).

30

10. A peptide having 19 amino acids, and having the following sequence: N G V Y T G L S T R N Q K T Y K T L K-NH<sub>2</sub> (SEQ ID NO:24).

11. The peptide of claim 5, 6, or 7 which is acetylated at its amino-terminus.

12. The peptide of claim 8, 9, or 10 which is acetylated at its amino-terminus.

35

13. A peptide having an amino acid sequence  
in the range of 15-39 amino acids, and comprising the  
amino acid sequence D X V Y X X L X X R N Q E X Y E T  
5 L K (SEQ ID NO:25), wherein X is any amino acid.

14. A compound of formula Ia or the  
carboxy-terminal amide thereof:

20

15. A compound of formula IIc

30

wherein X is OH or an amino-terminally linked peptide  
having a sequence in the range of 17-39 amino acids  
and comprising the sequence V Y T G L S T R N Q E T Y  
35 E T L K (part of SEQ ID NO:13).

16. A compound of formula IVa:

(IVa)

wherein X is a hydrogen atom or a carboxy-terminally linked peptide having a sequence in the range of 17-39 amino acids and comprising the sequence V Y T G L S T R N Q E T Y E T L K (part of SEQ ID NO:13).

17. A compound of the general formula V:

(V)

in which R<sup>1</sup> is an amino acid sequence of 4-25 amino acids, having a carboxy-terminal L, and a Y in the fourth position counting from the carboxy- to amino-terminal direction; R<sup>2</sup> is an amino acid sequence of 4-6 amino acids, having an amino-terminal Y, and an L or I in the fourth position counting from the amino- to

carboxy-terminal direction;  $R^3$  is a hydrogen atom or an alkyl group of 1-6 carbon atoms; Z is S, SO, or SO<sub>2</sub>.

- 5 18. The compound of claim 17 which is of formula Va:

10

20

19. The compound of claim 17 in which  $R^3$  is a hydrogen atom; Z is S;  $R^2$  is Y E T L K-NH<sub>2</sub> (part of SEQ ID NO:17); and  $R^1$  is D G V Y T G L (part of SEQ ID NO:17), or Q K V Y D K L (part of SEQ ID NO:19).

30

20. A pharmaceutical composition comprising a therapeutically effective amount of the peptide of claim 1; and a pharmaceutically acceptable carrier.

35

21. A pharmaceutical composition comprising a therapeutically effective amount of the peptide of claim 2, 3, or 4; and a pharmaceutically acceptable carrier.

22. A pharmaceutical composition comprising  
a therapeutically effective amount of the peptide of  
claim 5, 6, or 7; and a pharmaceutically acceptable  
5 carrier.

23. A pharmaceutical composition comprising  
a therapeutically effective amount of the peptide of  
claim 8, 9, or 10; and a pharmaceutically acceptable  
10 carrier.

24. A pharmaceutical composition comprising  
a therapeutically effective amount of the peptide of  
claim 13; and a pharmaceutically acceptable carrier.

15 25. A pharmaceutical composition comprising  
a therapeutically effective amount of the compound of  
claim 14; and a pharmaceutically acceptable carrier.

20 26. A pharmaceutical composition comprising  
a therapeutically effective amount of the compound of  
claim 15 or 16; and a pharmaceutically acceptable  
carrier.

25 27. A pharmaceutical composition comprising  
a therapeutically effective amount of the compound of  
claim 17; and a pharmaceutically acceptable carrier.

28. A pharmaceutical composition comprising  
30 a therapeutically effective amount of the compound of  
claim 18 or 19; and a pharmaceutically acceptable  
carrier.

29. The composition of claim 20, 25, or 27  
35 in which the pharmaceutically acceptable carrier is a  
propellant.

30. An inhaler containing a composition comprising the peptide of claim 1.

5 31. An inhaler containing a composition comprising the compound of claim 14.

32. An inhaler containing a composition comprising the compound of claim 17.

10 33. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or  
15 prophylactically effective amount of the peptide of claim 1 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

20 34. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or  
25 prophylactically effective amount of the peptide of claim 2 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

30 35. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or  
35 prophylactically effective amount of the peptide of claim 3 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

36. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or prophylactically effective amount of the peptide of claim 5, 6, or 7 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

37. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or prophylactically effective amount of the peptide of claim 8, 9, or 10 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

38. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or prophylactically effective amount of the peptide of claim 12 to a subject having or suspected of having a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

39. A method of treating or preventing a disease or disorder associated with undesirable or inappropriate immune system activity or inflammation comprising administering a therapeutically or prophylactically effective amount of the compound of claim 14 to a subject having or suspected of having a

disease or disorder associated with undesirable or inappropriate immune system activity or inflammation.

5                   40. A method of treating or preventing a  
disease or disorder associated with undesirable or  
inappropriate immune system activity or inflammation  
comprising administering a therapeutically or  
prophylactically effective amount of the compound of  
10 claim 15 or 16 to a subject having or suspected of  
having a disease or disorder associated with  
undesirable or inappropriate immune system activity or  
inflammation.

15                   41. A method of treating or preventing a  
disease or disorder associated with undesirable or  
inappropriate immune system activity or inflammation  
comprising administering a therapeutically or  
prophylactically effective amount of the compound of  
20 claim 18 to a subject having or suspected of having a  
disease or disorder associated with undesirable or  
inappropriate immune system activity or inflammation.

25                   42. A method of treating or preventing a  
disease or disorder associated with undesirable or  
inappropriate immune system activity or inflammation  
comprising administering a therapeutically or  
prophylactically effective amount of the compound of  
claim 19 to a subject having or suspected of having a  
30 disease or disorder associated with undesirable or  
inappropriate immune system activity or inflammation.
